MBBCh final examination

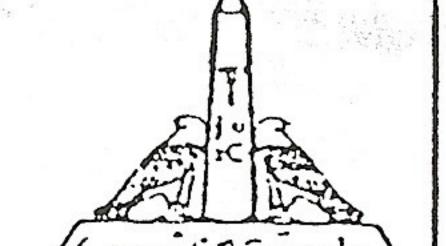

Cairo, January 2009

Organized Performance Clinical Examination (OSPE)

Total questions: 25

Total marks: 50 marks

Time Allowed: 50 Minutes

Direction: Select the ONE best lettered answer or completion in each question.

1-) The diameter marked "red" is the engaging diameter when the setal head is: .

suboccipité bregi

a) extended at the occipto-posterior position

b) presenting by the brow!

fully flexed at the occipto-anterior position:

d) extended at the occipto-anterior position

e) presenting as the aftercoming head of the breech

2) The "red" arrow indicates a structure that contain: -> Pudondal Canal.

a) the uterine artery

b) the external pudendal vessels

c) the internal pudendal vessels and nerves.

d) the ureter

e) the internal iliac vessels.

(3) Which structure is the most common to get infected?

a) structure numbered "1"

b) structure numbered "2"

c) structure numbered "3"

d) structure numbered "4"

e) structure numbered "5"

(4) The sign "X" indicates characteristic fluctuation of the blood level of a certain hormone, during the normal ovulatory cycle. The INCORRECT statement regarding that hormone:

a) it is also produced by the normal human placenta :

b) its production is activated by GnRH /

it inhibits the growth of the ovarian follicles is

its production is diminished by increasing estrogen levels (negative feedback) /

it is water soluble

A 35-year-old G3P2 presented at(8) weeks pregnancy with mild vaginal bleeding for 3 days. She passed fleshy tissues per vagina as shown in the slide. Further investigations DO NOT include: ,

a) chest X-ray \square

amniocentesis !

c) serum B-hCG /

d) pelvic ultrasound /

e) complete blood count (CBC) /

6. A 26-year-old primigravida presented at 8 weeks pregnancy. Her hands were swollen with loss of the normally seen tendons and boney prominences. Which is NOT a possible diagnosis?

malnutrition

renal insufficiency

preeclampsia

heart failure

liver cell failure

-> Barthollin's gland

Nitrazine test on fluid collected f	com the vacine of			
Nitrazine test on fluid collected f showed a blue color. What is the	nossible significant	a pregnant womar	at gestational	age off 32 Voor
a) normal vaginal discharget	possione significan	ce of that result?		
b) fungal infection +		`	2	
rupture of fetal membranes and	leakage of amainti-	-3	$\langle \cdot \rangle$	
d) urinary incontinence f-	reakage of ammotic	fluid /		
e) none of the above				
(8-) A hematoma was found on inspec	ction of the			
(8-) A hematoma was found on inspectations for this condition DO NOT	Chon of the mater	nal side of the pla	icenta after deli	very. The ris
a) preeclampsia /	i include:			J
b) smoking	253			
ter iron desiciency anemia	P			
d) chronic hypertension /		•		
() e) external trauma to the abdomen :				
9- Which is the INCORRECT stateme	ont for Al			
β-subunit hCG is expected to do	ble over 40 t			X
β-subunit hCG is expected to dou b) laparoscopy is the traditional stance c) tubal pregnancy commonly present	dard method to	n case of ectopic pr	egnancy	
c) tubal pregnancy commonly preser	at with abdominal	firm the diagnosis		11
a) modern nonsurgical treatment is a	in ontion	am	٧٠٠.	
(i) mistory of previous salpingitis is re	elevant			
Which is a CONTRAINDICATION	or such drug?	DOTHXOL- is	M	
a) madelion of labor ,	L. L.	.54	}

A case of obstructed labor as the ante- NOT a risk factor for such case to hap	MODESHOURGEE IS W	edged behind the	symphysis pubi	s. Which is
a) Previous history of such event in prev	vious and		•	
b) Maternal diabetes mellitus	rious bredugues.		· \.	
Maternal hypertension			A. Maria	
d) macrosomia.				
c) anencephals.				
		•		
		VOV (71)		•

15- Which is the INCORRECT statement regarding that type of imaging investigation? a) it detects all malignant lesions mamography b) it is soft tissue X-ray study c) the findings are not specific for any lesion d) the main value is for regular screening of asymptomatic women e) calcification within soft tissue density is suspicious for malignancy 16-Which is the INCORRECT statement for the condition "X"? a) commonly it is associated with stress incontinence. b) it might be complicated by urinary tract infection c) at the early stages might present with frequency of micturation d) it may be related to postmenopausal phase of life is best treated with physiotherapy 17- The INCORRECT statement for that pelvi-abdominal swelling: it is definitely pathological b) it could be due to malignant ovarian tumor c) it could be due to benign ovarian tumor d) it could be due to fibroid uterus e) it could be due to imperforate hymen 18- Which is the INCORRECT statement regarding this instrument? a) indications include determination of the direction of the uterus (AVF or RVF) b) it is used to differentiate between corporeal polypi and cervical polypi c) it is used to differentiate between fibroid polyp and chronic inversion of the uterus d) it can be used to confirm vesicovaginal fistula (e) complications include development of intrauterine adhesions 19- The INCORRECT statement regarding that lesion: a) It may be asymptomatic b) It may be responsible for chronic acyclic pelvic pain c) The only presenting symptom might be infertility d) It might be associated with luteal insufficiency The process of ovulation is not disturbed in patients with endometriosis 20- Which is the INCORRECT statement regarding the pathological lesion? a) nonsurgical treatment is usually effective b) urinary incontinence is not related to stress c) urinary incontinence is continuous day and hight d) patient do no have any desire to micturate e) the condition is commonly associated with secondary amenorrhea 21- The CORRECT statement for that perincal tear: a) the vulva, vagina, external anal sphincter are the only involved structures b) chorioamnionitis) is a leading cause clinical examination shows two dimples at the sides of the anus (ends of the torn external anal sphincter) d) anal tone is preserved if the patient constricts herself e) surgical repair is to be done immediately, if discovered within the first week after delivery 22- That patient is suffering from: a) urethrocele b) cystocele c) vault prolapse d) rectocele of urethrocystocele

23- That findings at mid-cycle assessment of a case of primary infertility indicate: 12 of a) abnormal clinical inspection and normal cervical mucus

normal clinical inspection and abnormal cervical mucus

abnormal clinical inspection and abnormal cervical mucus

completely normal findings of an ovulatory cycle

nonconclusive data

24- That patient is having an ovarian tumor. That examination is to evaluate:

the jugular venous pulse

the superaclavicular group of lymph nodes

the thyroid gland

the carotid pulse

none of the above

25- That IUD device DO NOT:

a) increase prostaglandin production

increase leucocyte endometrial infiltration

jahibit sperm mobility

interfere with steroidogenesis.

inhibit implantation of the fertilized ovum

GOOD LUCK
